# Validity of Diagnosis

## Across

4. This type of validity relies on the person receiving the same diagnosis from two or more different classification systems
7. A diagnosis can be said to have good predictive validity if it is able to accurately predict how a person will respond to...
8. A prediction about the likely course of a condition
9. Just because two doctors give the same diagnosis it does not mean it is....

## Down

1. A diagnosis has this type of validity if people with the same label display similar clusters of symptoms
2. A diagnosis has this type of validity if a person receives the same diagnosis using a different classification system at some point in the future.
3. People with the same diagnosis will have been exposed to similar risk factors, be they genetic or environmental
5. Receiving a diagnosis should be ... to the person and their family as it provides them with a starting point regarding how to help the individual to gain the specific support that they need
6. A valid diagnosis should be ....i.e. people will feel that they understand more about treatment possibilities and what they should expect over time
